- Stable Diffusion Model (earlier)
- Stable Diffusion 3.5
- Flux

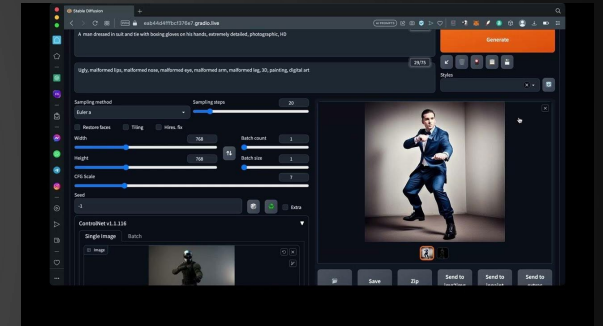

Prompt Weights

Using () in the prompt increases the model's attention to enclosed words, and [] decreases it. You can combine multiple modifiers

The following syntax applies to SD WebUI (auto1111) GUI.

Prompt Weights

a photo of eggs and (((bacon)))
on a frying pan, Greg Rutkowski

a photo of eggs and ((bacon)) on
a frying pan, Greg Rutkowski

a photo of eggs and (bacon) on a
frying pan, Greg Rutkowski

a photo of eggs and bacon on a
frying pan, Greg Rutkowski

a photo of (eggs) and bacon on a
frying pan, Greg Rutkowski

a photo of ((eggs)) and bacon on a
frying pan, Greg Rutkowski

a photo of (((eggs))) and bacon
on a frying pan, Greg Rutkowski

α (**word**) - increase attention to **word** by a factor of 1.1

α ((**word**)) - increase attention to **word** by a factor of 1.21 ($= 1.1 * 1.1$)

α [**word**] - decrease attention to **word** by a factor of 1.1

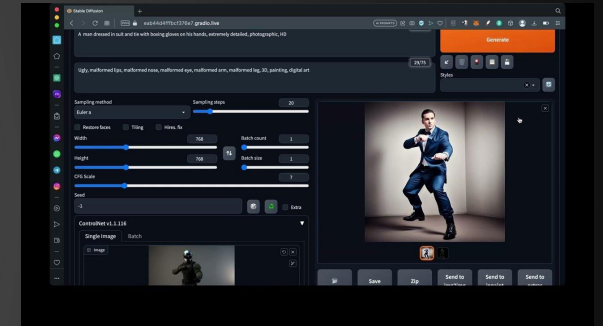

α (**word:1.5**) - increase attention to word by a factor of 1.5

α (**word:0.25**) - decrease attention to word by a factor of 4 ($= 1 / 0.25$)

α \(\b{word}\) - use literal () characters in prompt

The following syntax applies to SD WebUI (auto1111) GUI.

Keyword Blending

You can mix two keywords. The proper term is **prompt scheduling**. The syntax is **[keyword1 : keyword2: factor]**

factor controls at which step **keyword1** is switched to **keyword2**. It is a number between 0 and 1.

The following syntax applies to SD WebUI (auto1111) GUI.

Keyword Blending

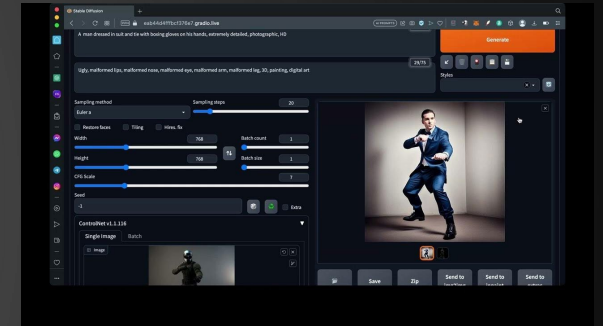

For example, if I use the prompt - **Oil painting portrait of [Joe Biden: Donald Trump: 0.5]** for 30 sampling steps.

That means the prompt in steps 1 to 15 is **Oil painting portrait of Joe Biden**

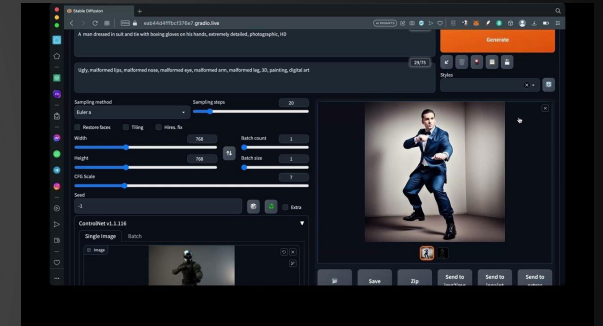

And the prompt in steps 16 to 30 becomes **Oil painting portrait of Donald Trump**

The factor determines when the keyword is changed after 30 steps $\times 0.5 = 15$ steps. The effect of changing the factor is blending the two presidents to **different degrees**.

The following syntax applies to SD WebUI (auto1111) GUI.

Keyword Blending

You may have noticed Trump is in a white suit which is more of a Joe outfit. This is a perfect example of a very important rule for keyword blending:

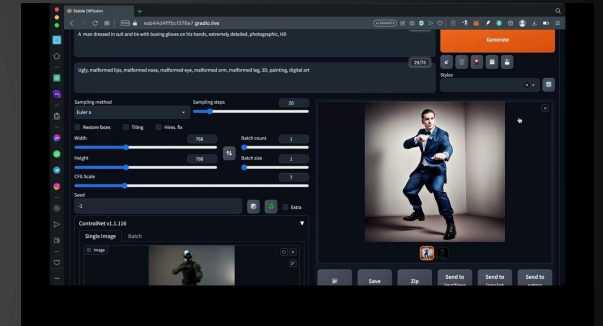

The first keyword dictates the global composition. The early diffusion steps set the overall composition. The later steps refine details.

Commonly used for **Blending faces**

The following syntax applies to SD WebUI (auto1111) GUI.

Prompt Length

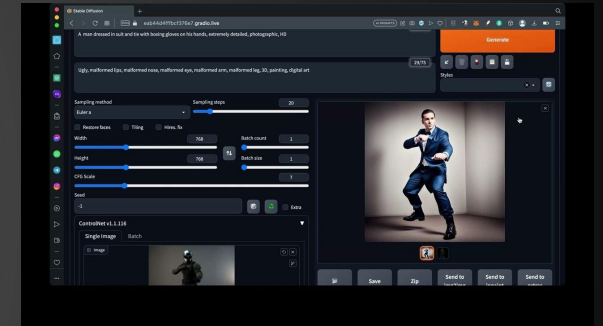

SD WebUI (auto1111) has no token limits. If a prompt contains more than 75 tokens, the limit of the CLIP tokenizer, it will start a new chunk of another 75 tokens, so the new “limit” becomes 150. The process can continue forever or until your computer runs out of memory...

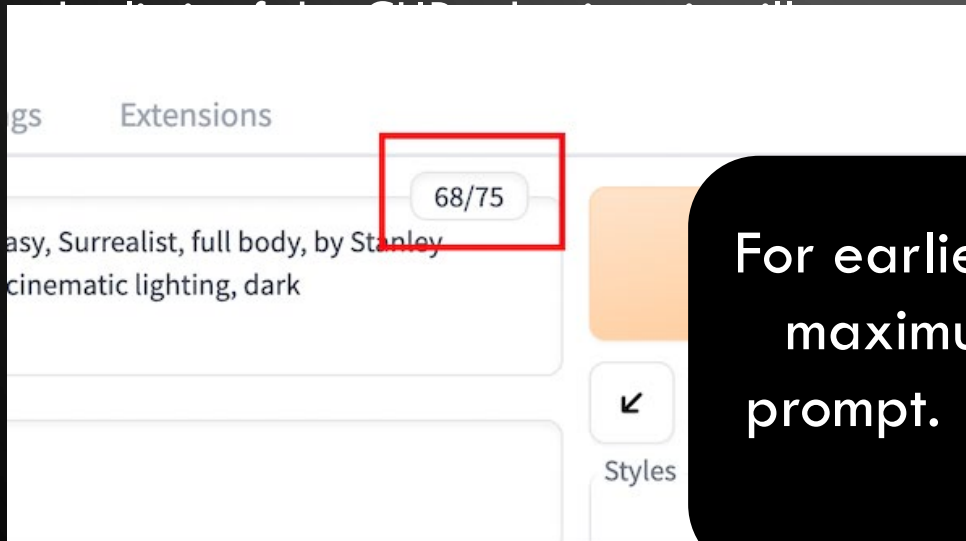

Each chunk of 75 tokens is processed independently, and the resulting representations are concatenated before feeding into Stable Diffusion’s U-Net.

The following syntax applies to SD WebUI (auto1111) GUI.

Prompt Length

SD WebUI (auto1111) has no token limits. If a prompt contains more than 75 tokens, it will automatically split the prompt into new chunks of another 75 tokens, so the generation will continue forever or until your computer runs out of memory.

For earlier Stable Diffusion Models, there could be a maximum number of keywords you can use in the prompt. In the basic Stable Diffusion v1 model, that limit is **75 tokens**.

The following syntax applies to SD WebUI (auto1111) GUI.

1. **Subject** (required)
2. Medium
3. Style
4. Artist
5. Website
6. Resolution
7. Details
8. Color
9. Lighting

Stable Diffusion prompt: a definitive guide

1. Subject (required)
2. Medium
3. Style
4. Artist
5. Website
6. Resolution
7. Details
8. Color
9. Lighting

Subject

“A young woman with light blue dress sitting next to a wooden window reading a book.”

A common mistake of a beginner is not describing the image in enough detail. What clothing does she wear? What’s her hairstyle? These seemingly minor elements can contribute significantly to the overall image being conveyed. Without specifying these details, you leave them open to the AI generator, and you may be disappointed about what you get.

It is a good practice to include a generic negative prompt.

ugly, deform, disfigured

1. Subject (required)
2. Medium
3. Style
4. Artist
5. Website
6. Resolution
7. Details
8. Color
9. Lighting

Medium

We can be more specific. Let's add a medium, the material that the artwork is created on. Some examples are digital painting, photography, and oil painting. Let's use

Digital painting

The new prompt is

Digital painting of a young woman with light blue dress sitting next to a wooden window reading a book

1. **Subject** (required)
2. **Medium**
3. **Style**
4. **Artist**
5. **Website**
6. **Resolution**
7. **Details**
8. **Color**
9. **Lighting**

Style

We can be more specific. Let's add a medium, the material that the artwork is created on. Some examples are digital painting, photography, and oil painting. Let's use

Digital painting

The new prompt is

Digital painting of a young woman with light blue dress sitting next to a wooden window reading a book

1. Subject (required)
2. Medium
3. Style
4. Artist
5. Website
6. Resolution
7. Details
8. Color
9. Lighting

Artist , Website

Artist – specifying the artist who created the art to steer the style.

by Stanley Artgerm Lau

Website – The name of the website can be used for a particular genre.

ArtStation

Stable Diffusion models in the earlier years has such prompt keywords.

(ongoing lawsuits ?)

1. Subject (required)
2. Medium
3. Style
4. Artist
5. Website
6. Resolution
7. Details
8. Color
9. Lighting

Resolution, Details

Resolution represents how sharp and detailed the image is. Let's add keywords **highly detailed** and **sharp focus**.

Additional details are *sweeteners* added to modify an image. We will add **sci-fi** and **dystopian** to add some vibe to the image.

1. Subject (required)
2. Medium
3. Style
4. Artist
5. Website
6. Resolution
7. Details
8. Color
9. Lighting

Color, Lighting

You can control the overall color of the image by adding **color keywords**. The colors you specified may appear as a tone or in objects. E.g.

iridescent gold

Any photographer would tell you lighting is key to creating successful images. Lighting keywords can have a huge effect on how the image looks. Let's add **studio lighting** to make it studio photo-like.

How to come up with good prompts for Stable Diffusion

Updated March 19, 2024 · By [Andrew](#) · Categorized as [Tutorial](#) · Tagged [Beginner](#), [Txt2img](#) · [17 Comments](#)

Prompt building is a basic skill any Stable Diffusion user should master. By understanding how to construct clear and concise prompts, you can unlock the whole range of style Stable Diffusion offers. To excel in prompt building, you should

Stable Diffusion prompt: a definitive guide

Updated January 4, 2024 · By [Andrew](#) · Categorized as [Tutorial](#) · Tagged [Beginner](#), [Txt2img](#) · [64 Comments](#)

Developing a process to build good prompts is the first step every Stable Diffusion user tackles. This article summarizes the process and techniques developed through experimentations and other users' inputs. The goal is to write down all I know about prompts so you can know them all in one place.

Negative Prompt work ?

The negative prompt is an additional way to nudge Stable Diffusion to give you what you want. You can use a negative prompt with all the convenience of text input.

Using Stable Diffusion v1.5 with the prompt: **Portrait photo of a man.**

OK, we got what we expected. Let's try removing their mustaches to lighten them up. Let's try prompt: **Portrait photo of a man without mustache.**

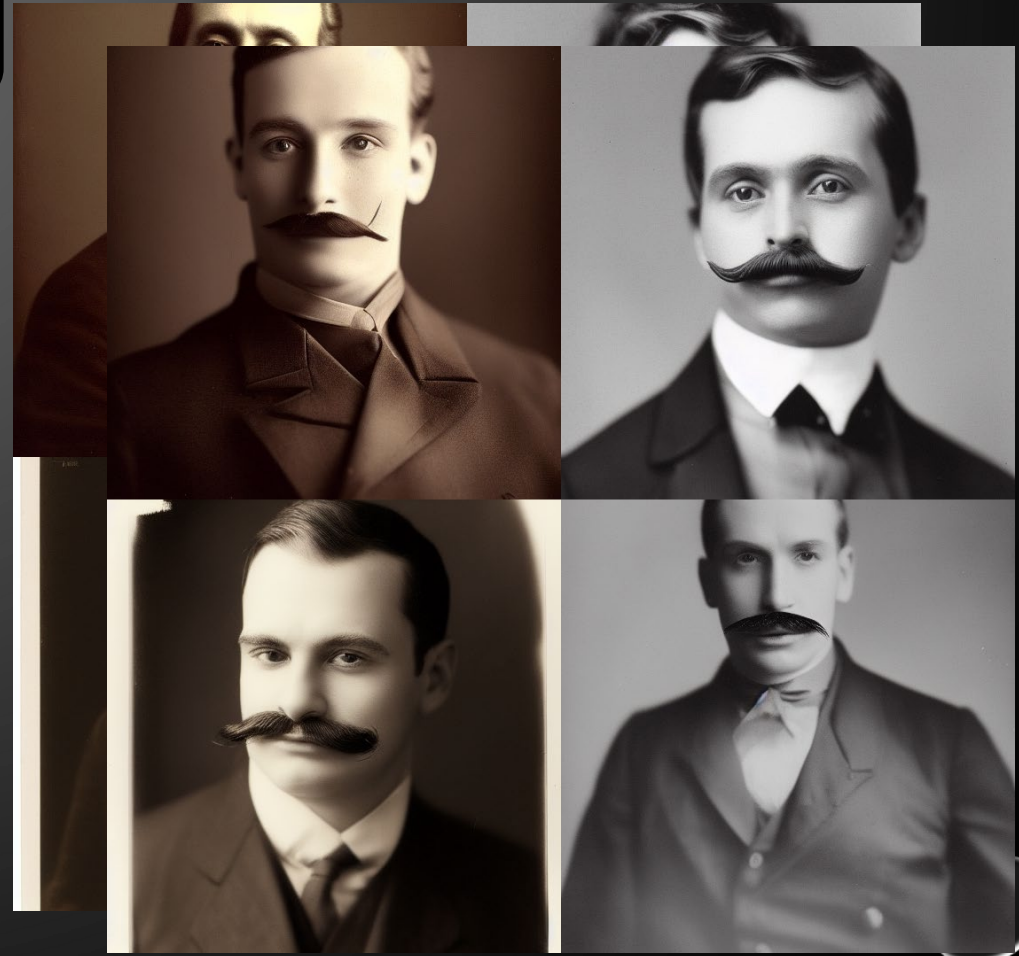

Negative Prompt work ?

We have a problem here. We get even more prominent mustaches! What's going on? The culprit is likely the failure of cross-attention to associate "without" and "mustache". Stable Diffusion understood the prompt as "man" and "mustache". That's why you see both of them.

Using Stable Diffusion v1.5 with the prompt: **Portrait photo of a man.**

OK, we got what we expected. Let's try removing their mustaches to lighten them up. Let's try prompt: **Portrait photo of a man without mustache.**

Positive & Negative Prompt

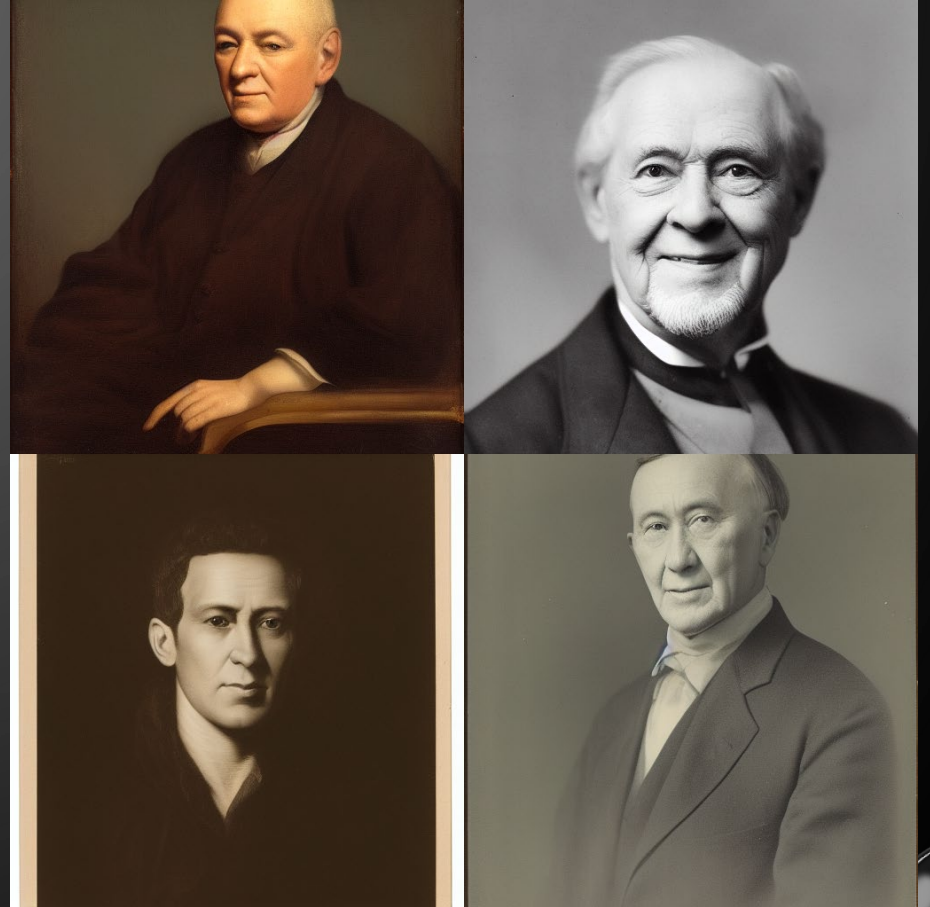

So what can we do to generate men without mustache? Is this something Stable Diffusion cannot do? The answer is using negative prompts. If we use the prompt

Positive Prompt:

Portrait photo of a man.

together with the negative prompt

Mustache

Universal Negative Prompt

We will put the universal negative prompt for v2 we just found to a battery of test to see how well it performs.

Negative Prompt:

ugly, tiling, poorly drawn hands, poorly drawn feet, poorly drawn face, out of frame, extra limbs, disfigured, deformed, body out of frame, bad anatomy, watermark, signature, cut off, low contrast, underexposed, overexposed, bad art, beginner, amateur, distorted face

Universal Negative Prompt

We will put the universal well it performs.

Negative Prompt:

ugly, tiling, poorly drawn hands, poorly drawn feet, poorly drawn face, out of frame, extra limbs, disfigured, deformed, body out of frame, bad anatomy, watermark, signature, cut off, low contrast, underexposed, overexposed, bad art, beginner, amateur, distorted face

What is NSFW in negative prompt?

This is where NSFW (Not Safe For Work) negative prompts come into play. These prompts help filter out inappropriate or explicit content, ensuring that the generated images adhere to acceptable standards.

How does negative prompt work?

Updated December 3, 2023 · By [Andrew](#) · Categorized as [Tutorial](#) · Tagged [Fundamentals](#), [Txt2img](#) · [4 Comments](#)

The negative prompt is an additional way to nudge Stable Diffusion to give you what you want. Unlike [inpainting](#), which requires drawing a mask, you can use a negative prompt with all the convenience of text input. In fact, some images can only be generated by using negative prompts.

In this article, we will review a simple example of using a negative prompt. Then, you will learn how a negative prompt works in Stable Diffusion.

How to use negative prompts?

Updated November 15, 2023 · By [Andrew](#) · Categorized as [Tutorial](#) · Tagged [Txt2img](#) · [12 Comments](#)

You put what you DON'T want to see in the negative prompt. It gives you an additional way to control text-to-image generation. Many people treat it as an optional feature in Stable Diffusion v1.5. Things changed with the release of Stable Diffusion v2. The negative prompt becomes indispensable.

In this post, I will walk through a few use cases of negative prompts, including modifying content and style. Then, I will demonstrate the importance of negative prompts in v2 models. I will demonstrate how to search for a **universal negative prompt**.

Stable Diffusion

3.5 Prompt

Guide

Stable Diffusion 3.5

Stability AI developed Stable Diffusion 3.5 Large, an 8.1 billion parameter Multimodal Diffusion Transformer (MMDiT) model. It includes several important improvements over older versions:

- **Superior Image Quality:** It generates highly detailed images up to 1 megapixel resolution (1024×1024 pixels).
- **Enhanced Prompt Adherence:** The model accurately follows text instructions. This is essential for generating specific road scenes.
- **Query-Key Normalization:** This architectural improvement stabilizes the training process. It also simplifies further fine-tuning.
- **Multiple Text Encoders:** The model uses three fixed, pretrained text encoders. This helps it understand text better.
- **Diverse Outputs:** It creates images that show diverse people and scenarios without needing complex prompts.

TEXT

The SD3.5 models can incorporate text into images. To achieve the best results, enclose the text in “double quotes” and keep the desired words or phrases short.

Prompt: "Generate your Dreams" are written across the image in block type. Elemental, crystal, hyper realistic; dynamic lighting, hyper detailed, intricately detailed, triadic colors. The words "SD 3.5" are in the bottom right corner.

Prompt: We are inside a modern living room decorated in muted colors. A large bay window covers the wall, the view beyond is of a rocky coast and the ocean. The words "Your Next Vacation Awaits!" are written across the image in a large script font, drop shadow, glowing edges around the words.

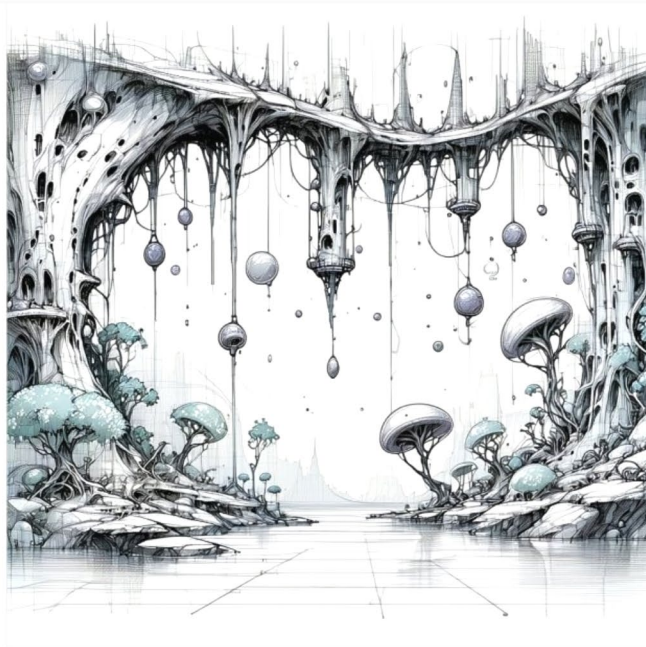

Prompt: A large running shoe sits on a table, its red laces dangling over its blue canvas upper and white sole. The words "Sports Are Fun" are scrawled across the image in green letters.

Style

Define the aesthetic direction, such as illustration style, painting medium, digital art style, or photography. Experiment and blend styles such as line art, watercolor, oil painting, surrealism, expressionism, and product photography.

Prompt: Expressionist painting of a bustling city street at night, lights glowing with vibrant colors reflecting off wet pavement.

Prompt: Black and white, line art drawing of a hanging garden in an alien world.

Prompt: Isometric voxel art of a gamer's room with RGB-lit computer setup, posters on the wall, a character gaming in a chair, and a cat sitting on the desk by the keyboard.

Subject and Action

If your image has a subject, the prompt should be written to amplify its presence first and any actions the subject takes afterward. Consider the images and prompts below.

Prompt: Low-angle side shot of a cute robot cycling through Central Park with colorful shades on.

Prompt: Wide shot of an elderly couple holding hands on a quiet beach at sunset, looking out at the waves. Their silhouettes are framed against the soft orange glow of the horizon, conveying warmth, companionship, and peace.

Prompt: Wide shot of a doctor standing in a crowded hospital hallway, facing the camera with a compassionate and resilient expression. Medical staff and patients move in the background, capturing the high-energy environment.

Composition and Framing

Describe the desired composition and framing of the image by specifying close-up shots or wide-angle views.

Prompt: Cinematic photography, close up, a banana laying on a table, slanted shadows wash across it, soft, diffused lighting.

Prompt: Cinematic photography, close up, grapes laying on a table, slanted shadows wash across it, soft, diffused lighting.

Prompt: Cinematic photography, close up, mango laying on a table, slanted shadows wash across it, soft, diffused lighting.

Lighting and Color

Describe the lighting or shadows in the scene using terms like "backlight", "hard rim light", and "dynamic shadows".

Prompt: Soft, diffused, misty light. Deep, moody shadows. A vehicle sits under a tree, rusted and abandoned, its headlights shine with a yellow glow.

Prompt: Looking up at a stage, spotlights shining on the center, red velvet curtains hanging in thick folds on the side. A woman dressed in a black gown covered with sequins sings into a microphone, dynamic light, dynamic shadows.

Prompt: Wide shot of a couple dancing in an empty plaza at night, illuminated by backlighting from tall street lamps that cast a warm glow, dynamic lighting and dynamic shadows reflecting their graceful movement on the cobblestone ground.

Technical Parameters

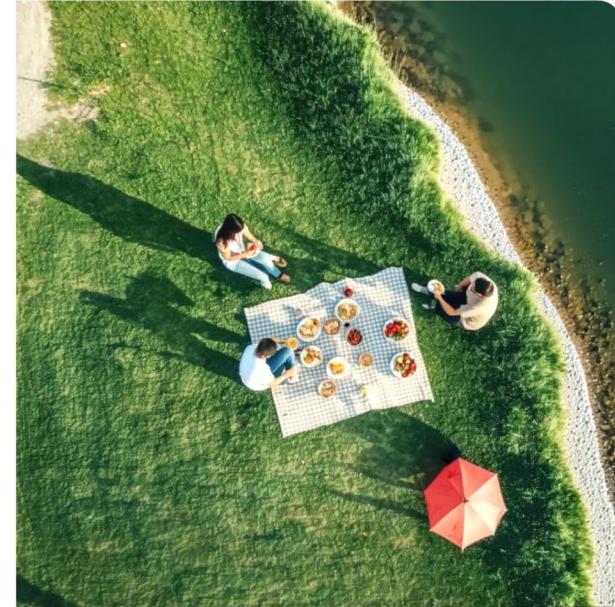

Specify technical parameters using cinematic terms to guide the desired perspective and framing. Terms like “bird’s eye view,” “close-up,” “crane shot,” and “wide-angle shot” can help direct the composition effectively. Consider using terms like “fish-eye lens” for a curved look to achieve unique visual effects.

Prompt: Side shot, close-up: medieval knight in heavy plate armor riding on a racing motorcycle down a busy city street, motion blur, traffic, bokeh background.

Prompt: Bird's eye view, drone fly-over footage: cinematic photography: action scene, looking down at a police car with flashing red lights racing down a street.

Prompt: Drone fly-over footage, people having lunch in a park by a lake.

Negative Prompting

Negative prompting allows precise control over colors and content. While the main prompt shapes the general image, negative prompts refine it by filtering out unwanted elements, textures, or hues, helping to achieve a focused, polished result. This enables more control over the final image, ensuring that distractions are minimized and that the output aligns closely with your intended vision.

No negative prompt

Prompt: Magical realism photo portrait, soft morning light, 30-something brunette woman, #hipster fashion, candid, hip.

With negative prompt

Positive: Magical realism photo portrait, soft morning light, 30-something brunette woman, #hipster fashion, candid, hip.
Negative: smooth, neon, 3D render.

FLUX

Basic Introduction

Flux

Flux (also known as FLUX.1) is a text-to-image model developed by Black Forest Labs (BFL). Black Forest Labs was founded by former employees of Stability AI. As with other text-to-image models, Flux generates images from natural language descriptions, called prompts. :

All public FLUX.1 models are based on a hybrid architecture of multimodal and parallel diffusion transformer blocks and scaled to 12B parameters. We improve over previous state-of-the-art diffusion models by building on flow matching, a general and conceptually simple method for training generative models, which includes diffusion as a special case.

Black Forest Labs (BFL) was founded in 2024 by Robin Rombach, Andreas Blattmann, and Patrick Esser, former employees of Stability AI. All three founders had previously researched the artificial intelligence image generation at Ludwig Maximilian University of Munich as research assistants under Björn Ommer.

TEXT

FLUX.1 Guide

Prompt Style

FLUX.1 works excellently with instructions written in natural language (meaning, you write as if you were communicating with a human); for most users, it will likely be the easiest way to prompt.

All of the typical prompt engineering tips still apply to FLUX.1. That means that you should:

- be precise, detailed and direct
 - describe not only the content of the image but also such details as tone, style, color palette, and point of view,
 - for photorealistic images, include the name of the device used (e.g., “shot on iPhone 16”), aperture, lens, and shot type.
- 

Layered Images

With some older models, it was difficult to precisely control different “layers” of an image, i.e., **the foreground, middle ground, and background**. FLUX.1 lets you craft complex compositions and define the placement of every object and person in the image: all that is needed is a good prompt.

Be clear about what you want to see in each layer and **convey it to the AI in an organized, hierarchical manner**. If you describe something in the foreground, move on to defining the background, then remember that you would like to have one more thing in the front; don't just tack it on at the end. Go back and add it to the first part.

“In the foreground, a vintage car with a 'CLASSIC' plate is parked on a cobblestone street. Behind it, a bustling market scene with colorful awnings. In the background, the silhouette of an old castle on a hill, shrouded in mist”

Contrasting Colors and Aesthetics

Contrasts can make for a striking image, whether photorealistic or digital art. For example, the top part of the image could have sad and gloomy vibes, while the bottom is cheerful and bright. Or the left side can be neon pink, and the right cyber blue.

Remember to also **describe the transition between the two concepts**. You decide if the “border” is abrupt and clearly visible, or if you’d prefer that the two aesthetics softly blend together.

“A single tree standing in the middle of the image. The left half of the tree has bright, vibrant green leaves under a bright, sunny blue sky, while the right half has bare branches covered in frost, with a cold, dark, thunderous sky. On the left there's green, lush grass on the ground; on the right - thick snow. The split is sharp, with the transition happening right down the middle of the tree”

See-through Materials and Textures

Objects or text visible behind glass, ice, plastic bags, and other transparent materials are often amazing visuals—but AI struggled to create those types of images. Thankfully, FLUX.1, especially [dev], brings significant improvements, provided you prompt it right.

You need to consider how to place objects in your image to achieve the desired result. For example, **explicitly state that object A should be in the front and object B should be behind it**. Or mention that something (like a beautiful landscape) is visible through something (e.g., a glass window).

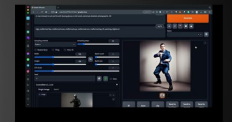

“A hanging glass terrarium featuring a miniature rainforest scene with colorful orchids and tiny waterfalls. Just beyond the glass, a neon sign reads 'Rainforest Retreat.' The rain-soaked glass creates a beautiful distortion, adding a soft glow to the sign's vibrant colors”

Prompt Weights

Some features and syntax you might know from other models and tools are not necessarily present in FLUX.1. Regarding prompting, the main difference is prompt weights, which, in Stable Diffusion-based models, allow users to put more or less focus ("weight") on certain parts of the prompt.

For example, "colorful garden (with a single rose)++" would mean the user wants to emphasize the "with a single rose" part of the prompt.

However, neither [dev] nor [schnell] support prompt weights in our Image Generator, so make sure you don't include them by the force of habit. As an alternative, you could use phrases such as "with emphasis on" or "with a focus on" in your prompt to guide the AI in the right direction.

attention to
combine

The following syntax applies to SD WebUI (auto1111) GUI.

Prompt Weights

neither [dev] nor [schnell] support prompt weights in our Image Generator, so make sure you don't include them by the force of habit.

As an alternative, you could use phrases such as "with emphasis on" or "with a focus on" in your prompt to guide the AI in the right direction.

WebUI (auto1111) GUI.

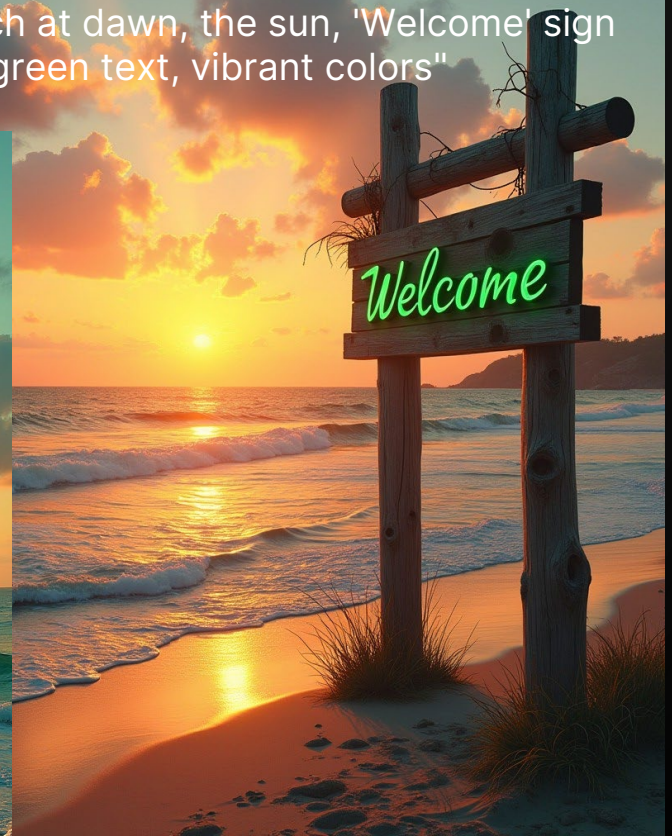

Chaotic Prompting

Think of prompting FLUX.1 as if you were trying to explain your desired output to a human artist you're commissioning. If you describe what you want in a disorganized manner, they might get confused and create precisely what you ordered... but not what you actually meant to say.

For example, if you want just the text on the image to be green, don't write "beach at dawn, the sun, 'Welcome' sign, green, vibrant colors." Instead, put it like this: "beach at dawn, the sun, 'Welcome' sign with green text, vibrant colors."

"beach at dawn, the sun, 'Welcome' sign with green text, vibrant colors"

Chaotic Prompting

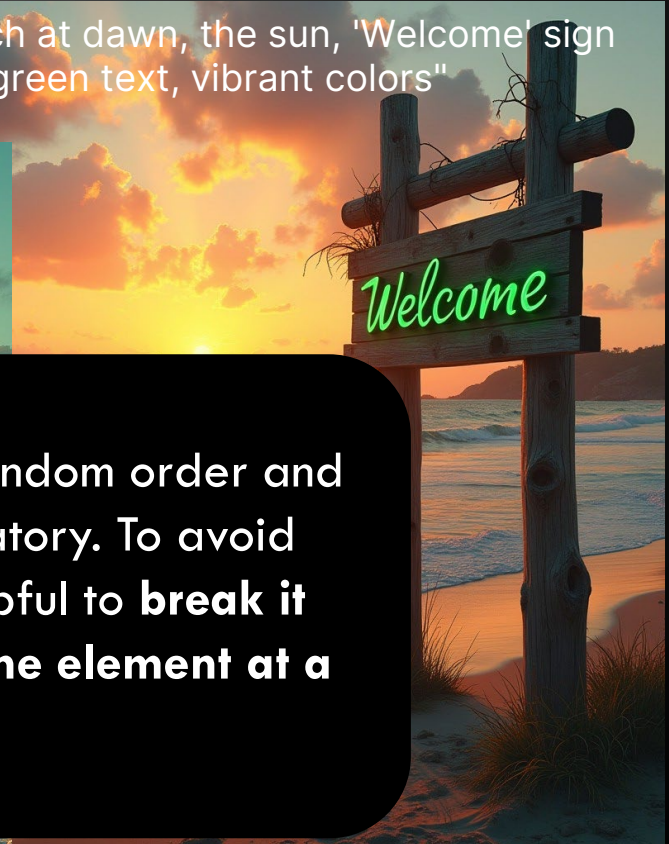

Think of prompting FLUX.1 as if you were trying to explain your desired output to a human artist you're commissioning. If you describe in a clear, logical manner, the AI will create what you want, not what it guesses.

For example, instead of the image prompt: "beach at dawn, vibrant colors, 'Welcome' sign with green text, vibrant colors."

So, the lesson is simple: don't just spam the AI with keywords in a random order and make it guess. The description should be logical and self-explanatory. To avoid getting lost when writing a more complex prompt, it might be helpful to **break it down into smaller chunks, i.e., shorter sentences focusing on one element at a time** (subject, text, tone, style, etc.).

"beach at dawn, the sun, 'Welcome' sign with green text, vibrant colors"

"beach at dawn, the sun, 'Welcome' sign, green, vibrant colors"

Guide to Writing Text to Image Prompts

Master AI image generation with our detailed guide. Learn to craft perfect prompts for your workflow for stunning results.

What is a prompt?

A **prompt** is a text description that tells an AI what kind of picture to create. It's the final image, from the big picture down to the tiniest detail. Generally speaking, the more detailed the prompt, the better the image.

Prompt engineering is about **crafting and optimizing prompts to achieve the best results**. Knowing how to write great prompts lets you fully tap into the power of AI image generation, creating stunning visuals.

Text to Image prompt presets

After logging in, check out getimg.ai's homepage, where you'll find **dozens of categories**, such as photography (e.g., macro, sepia, double-exposure), animation (e.g., Ghibli), and art styles (oil painting, graffiti, sketch).

Clicking on a preset will transport you to the AI Generator, with a prompt (and a visual reference). All you have to do is **edit it by describing your subject**.

Step 1. Start with the subject

Identify the **main subject of your image**. It could be a person (or multiple people), animal, object, or scene. Be as specific as possible. **Don't use verbs to instruct the model** (e.g., "create", "generate", "add"); simply describe what should be visible in the image.

Note:

The GPT Image and GPT Image HD models strictly do not allow generating images of real people (including public figures like "the president of the USA") or licensed properties (like "a Disney character"). Even broad prompts referencing these can be rejected automatically—these models are especially strict about these limitations.

For instance, instead of just "a dog", specify "a golden retriever puppy". Include specific poses or actions, e.g., "a golden retriever puppy wagging its tail" or "a golden retriever puppy standing on its hind legs."

| "a dog"

| "a golden retriever puppy"

| "a golden retriever puppy wagging its tail"

The background is a dark, gradient grey. It is decorated with numerous realistic water droplets of various sizes. Some droplets are large and prominent, while others are small and scattered. They are primarily located in the top-left and bottom-right corners, with a few smaller ones in the center and top-right areas. The droplets have highlights and shadows, giving them a three-dimensional appearance.
